ATLAS

Multi-Modal Tracking Solution

Election Edition

Overview

ATLAS

Overview

GNSS Wi Fi Bluetooth NB-IoT LTE-M

Clarity when it matters most

Election day is busy, time-critical, and often unpredictable.

ATLAS provides clear, dependable visibility throughout the day, helping election teams understand what is happening **without adding complexity**.

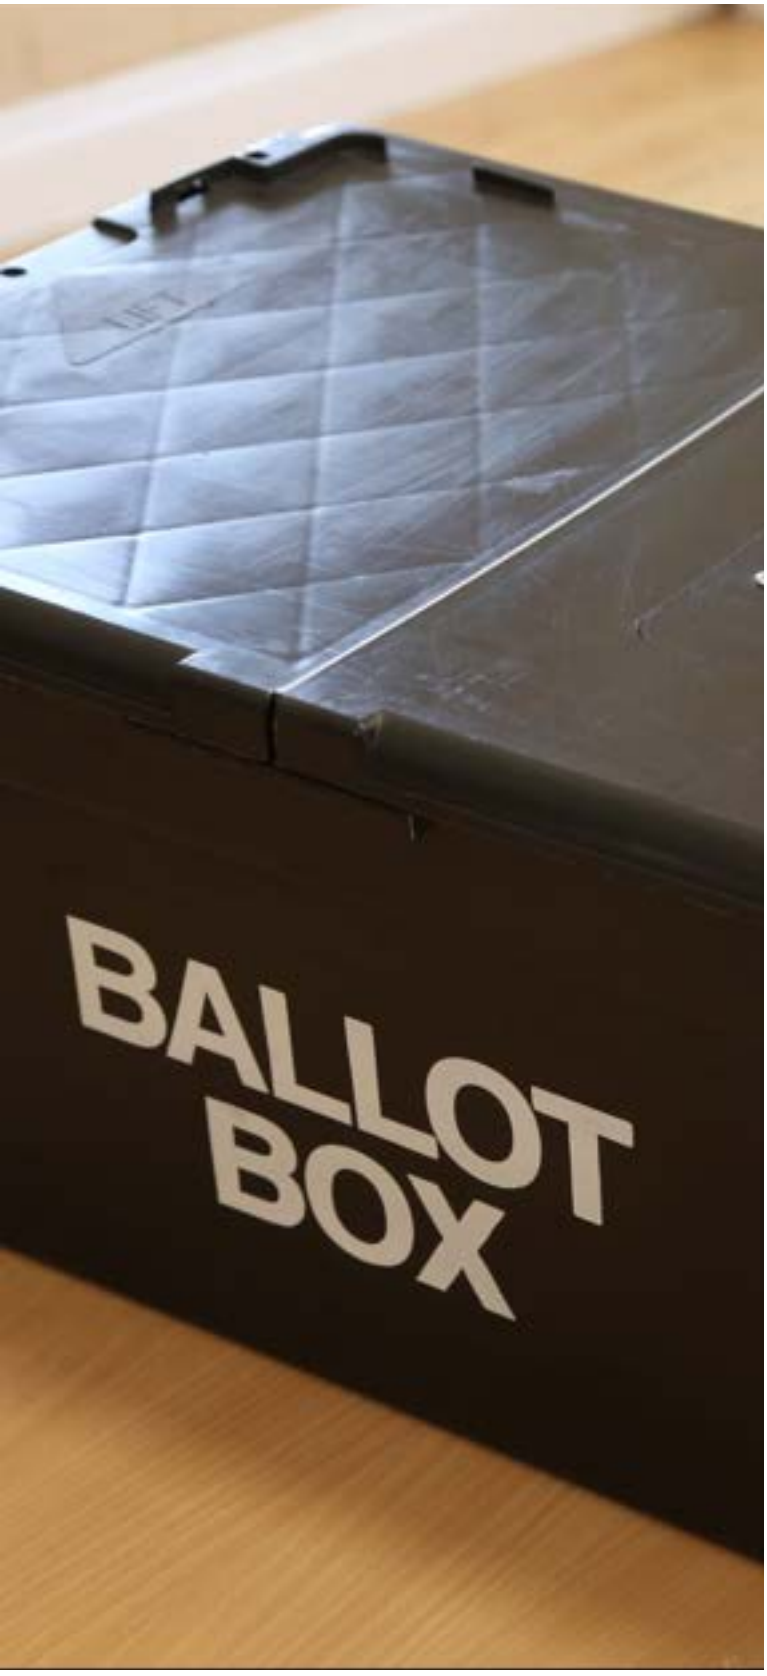

ATLAS is a multi-modal tracking system built around Satellite and Wi-Fi positioning, providing **reliable location awareness** both indoors and outdoors.

Where satellite coverage is limited or unavailable, Wi-Fi positioning maintains continuity, ensuring visibility is not lost as conditions change. Our **multi-network connectivity** ensures resilience across a wide range of environments.

During election day, **ATLAS** brings clarity, supporting confident decision-making in real time and producing clear **audit trails** afterwards.

ATLAS

Hardware

Reliability, built in

ATLAS hardware is built around compact tracking nodes designed to be placed in ballot boxes for reliable field deployment with **no intervention**.

Each node uses a combination of positioning technologies to maintain accuracy even in indoor environments such as **churches and schools**.

Connectivity is delivered via **multi-network SIM technology**, allowing nodes to operate across all major UK mobile networks. Network selection is automatic, improving resilience and reducing dependence on any single operator.

Low-power operation and long battery life allow nodes to be deployed in advance, remaining dormant until required, and then operating continuously through election day until the boxes are checked in at the count venue. This reduces handling and simplifies logistics.

ATLAS nodes can be configured to suit specific use cases, with optional sensors including **movement, tilt and impact detection** to provide additional context alongside location data.

ATLAS

Software

Designed for live oversight and post-event review

ATLAS software is cloud-based and web-native, allowing authorised users to access the system from any modern browser **without local installation**. This supports rapid deployment and consistent access across teams and locations.

The platform provides a **live map showing device locations** alongside polling stations, count venues and other relevant sites. These reference locations can be added in advance, improving visibility and helping teams understand movements in context throughout the day.

During live operation, the system presents current status and movement in a clear, structured view. Post election day, data remains available for **review, reporting and audit**, with exports supported in standard formats for internal records or external review.

All **ATLAS** software services are hosted within UK-based infrastructure, supporting data residency and regulatory compliance requirements.

ATLAS

Professional Services

Support to match your operational model

Our professional services are designed to fit around existing election processes, providing support where needed without introducing unnecessary complexity.

We can manage polling station and count venue data, including structured upload and validation within the **ATLAS** platform. Where required, cell signal surveys can be carried out in advance to support contingency planning and network resilience.

Deployment and election day support

ATLAS nodes can be deployed directly into ballot boxes by our team, ensuring consistent placement and configuration ahead of polling. A fully managed, turnkey option is available, where you provide polling station details and we manage preparation, deployment and on-site support during the election.

For teams preferring a hands-on approach, a self-service option is also available. Nodes are shipped ready for use, with secure web access to the **ATLAS** platform and remote support throughout deployment and election day.

Speak to us to discuss your requirements and arrange a live demonstration of ATLAS.
